

Quantum Crystals is a crystalline sample production company making use of well-established techniques, including solution-growth of single crystals in metallic fluxes. The company intends to provide researchers the opportunity to purchase samples which we produce or which they custom order for their scientific or technological investigation in academia and industry. So, crystalline samples are immediately available for purchase with a delivery time frame of 3-6 months.

Additionally, Quantum Crystals has dedicated resources to its own independent research efforts in attempt to provide the best products available. We provide single crystals suitable as samples for study and processing, and we will also provide valuable hierarchical structures made from our samples sold as complete and functional.

We are certain that our crystals can be a valuable contribution to any academic researcher in materials science, physics, or other STEM disciplines, or for R&D departments of corporations. In particular, as ongoing research in the past several decades has suggested, the quantum computing sector would be especially well-served by our crystalline samples, and we encourage inquiries to learn about our products and our team.
